

Chemistry 30 – Solubility Equilibrium – Unit Homework

Topic	Textbook Reading	Textbook Questions
Solutions and Solubility of Ionic Compounds	Section 15.1 (452-459) Section 10.3 (292-294)	#33-37
Solubility Equilibrium	Section 18.3 (577-581)	#17, 18
Ion Product Constant	Section 18.3 (581-583)	#19

Solutions and Solubility of Ionic Compounds

- Indicate if each substance is soluble or has low solubility. Write the dissociation equation for each, using the proper arrow (\rightarrow or \rightleftharpoons)
 - aluminum hydroxide
 - potassium hydroxide
 - sodium sulfate
 - lead(II) chloride
 - iron(III) phosphate
 - barium nitrate
 - ammonium phosphate
 - magnesium bromide
 - tin(IV) nitrate
 - copper(II) carbonate
- For each, write the molecular, total ionic and net ionic equations for the reaction. Remember that a complete equation includes coefficients, ion charges and states. Be sure to balance each reaction.
 - Strontium bromide and potassium sulfate solutions combine to produce a strontium sulfate precipitate.
 - Silver nitrate and potassium chloride solutions combine to produce a silver chloride precipitate.
 - Magnesium nitrate and sodium carbonate solutions combine to make a magnesium carbonate precipitate.
 - Manganese(II) chloride and ammonium carbonate solutions combine to produce a manganese(II) carbonate precipitate.
- For each pair of reactants, write the two possible products, then use the solubility rules to determine if a precipitate will form. If a reaction will occur, write the balanced molecular equation, including states, and the net ionic equation.
 - aluminum iodide + mercury(II) chloride \rightarrow
 - silver nitrate + potassium phosphate \rightarrow
 - copper(II) bromide + aluminum chloride \rightarrow
 - calcium acetate + sodium carbonate \rightarrow
 - ammonium chloride + mercury(I) acetate \rightarrow
 - calcium nitrate + hydrochloric acid (HCl) \rightarrow
 - iron(II) sulfide + hydrochloric acid \rightarrow
 - copper(II) hydroxide + acetic acid ($\text{HC}_2\text{H}_3\text{O}_2$) \rightarrow

Solubility Equilibrium

- How does the solubility of a compound relate to its K_{sp} ?
- For each compound, write a dissociation equation and a K_{sp} expression.
 - copper(I) chloride
 - lead(II) sulfate
 - zinc hydroxide
 - calcium phosphate

6. Calculate the K_{sp} for each of the salts whose solubility is listed below.
- $[\text{CaSO}_4] = 5.0 \times 10^{-3} \text{ mol/L}$
 - $[\text{MgF}_2] = 2.7 \times 10^{-3} \text{ mol/L}$
 - $[\text{SrF}_2] = 12.2 \text{ mg/100 mL}$ (hint: convert these units!)
7. For silver carbonate, iron(II) sulfide and calcium carbonate, calculate the solubility in mol/L for each of three salts. Use the Solubility Product Constants table to find K_{sp} .
8. Consider these slightly soluble salts:
- | | |
|----------------------------|--------------------------------|
| PbS | $K_{sp} = 8.4 \times 10^{-28}$ |
| PbSO_4 | $K_{sp} = 1.8 \times 10^{-8}$ |
| $\text{Pb}(\text{IO}_3)_2$ | $K_{sp} = 2.6 \times 10^{-13}$ |
- Which is the least soluble?
 - Calculate the solubility in mol/L for PbSO_4 .
 - How many grams of PbSO_4 can dissolve in 1 L of solution?
 - Use what you know about Le Chatelier's Principle to determine how can you decrease the concentration of $\text{Pb}^{2+}(\text{aq})$ in a saturated solution of PbSO_4 solution.
9. Given these slightly soluble salts:
- | | |
|---------------|---------------------------------|
| AgBr | $K_{sp} = 5.35 \times 10^{-13}$ |
| AgCl | $K_{sp} = 1.77 \times 10^{-10}$ |
| AgI | $K_{sp} = 8.52 \times 10^{-17}$ |
- Put them in order from most to least soluble.
 - For each, calculate the mass of solid needed to make 1.0 L of a saturated solution.
10. For a saturated solution of silver carbonate:
- Determine the concentration of silver ions.
 - Determine the mass of silver carbonate solid needed to make 500.0 mL of a saturated solution.

Ion Product Constant

11. Determine if a precipitate will form given the ion concentrations in the mixed solution.
- $[\text{Ca}^{2+}] = 3.5 \times 10^{-7} \text{ M}$, $[\text{SO}_4^{2-}] = 1.2 \times 10^{-4} \text{ M}$
 - $[\text{Ag}^+] = 1.2 \times 10^5 \text{ M}$, $[\text{Cl}^-] = 5.1 \times 10^{-3} \text{ M}$
12. Determine if a precipitate will form if 500.0 mL of each solution are mixed together.
- $[\text{FeCl}_2] = 4.3 \times 10^{-7} \text{ M}$, $[\text{NaOH}] = 8.1 \times 10^{-10} \text{ M}$
 - $[\text{AgNO}_3] = 4.2 \times 10^{-4} \text{ M}$, $[\text{KBr}] = 6.1 \times 10^{-4} \text{ M}$
13. Will a precipitate form if 200.0 mL 0.00020M $\text{Ca}(\text{NO}_3)_2$ is mixed 300.0 mL of 0.00030M Na_2CO_3 ?
14. Will a precipitate form if 25.0 mL of 0.0020M $\text{Pb}(\text{NO}_3)_2$ is mixed with 25.0 mL of 0.040M NaBr ?
15. Will a precipitate form if equal volumes of 0.00020M $\text{Ca}(\text{NO}_3)_2$ is mixed with 0.00030M Na_2CO_3 ?
